

This is unreleased documentation for alphaTab **1.5.0-alpha.1342** 🚧.

[Guides](#)[Export Data Model](#)

Export Data Model

since 1.2.0

After alphaTab has loaded a full `Score` object from any input source, it can also be exported again to one of the supported export formats. Supported export formats:

- Guitar Pro 7 (`alphaTab.exporter.Gp7Exporter`) since 1.2.0-alpha.75

NOTE

More exporters are planned for the 1.5 release unless special feature requests of users are incoming.

To export a `Score` object the corresponding exporter needs to be created and called. Then the resulting binary array can be used further to trigger a download, send it to a server, save it to a file etc.

JavaScript **C#**

```
const exporter = new alphaTab.exporter.Gp7Exporter();
const data = exporter.export(api.score, api.settings); // will return a
Uint8Array

// trigger download
const a = document.createElement('a');
a.download = api.score.title.length > 0 ? api.score.title + '.gp' :
'Untitled.gp';
a.href = URL.createObjectURL(new Blob([data]));
document.body.appendChild(a);
a.click();
document.body.removeChild(a);
```
